3.2 Design: The Cascadia Clip® Fiberglass Thermal Spacer is installed between the exterior wall cladding and structural substrate walls of steel framing, wood studs, concrete or concrete masonry. Supporting structural walls shall be designed to support the design loads. Allowable shear loads and compressive loads per spacer are shown in Table 1 of this report. Allowable wind loads (suction) are determined from recognized values for the screw fastener attached to the substrate and the cladding system’s recognized load capacity, whichever is lower. Spacing of the Cascadia Clip shall be determined by the engineering design. Typical spacings are 16-inches-on-center (406 mm) horizontally and 26-inches-on-center (660 mm) vertically.

\(^1\) Two No.14 self-drilling screws per Spacer.
\(^2\) Minimum No. 20 gage steel studs
\(^3\) Direction of load.

3.3 Installation: The Cascadia Clip® Fiberglass Thermal Spacers shall be installed in accordance with the manufacturer’s published installation instructions, this evaluation report, and the applicable code. If there are any conflicts between the manufacturer’s published installation instructions and this report, the more restrictive shall govern.

3.3.1 General: The Cascadia Clip® Fiberglass Thermal Spacers are installed directly between structural back-up walls of steel framing, wood studs, concrete or concrete masonry, and horizontal or vertical cladding support members using two No.14 self-drilling screws passing through each spacer. Steel studs shall be minimum No. 20 gage [0.033-inch (0.84 mm) base metal thickness]. Spacers are installed with their fasteners aligned in the vertical orientation. The cladding support channels may span either vertically or horizontally. Figure No. 1 of this report provides typical installation details.

3.3.2 Installation with Vertical Type Clips: The spacers are attached by clipping the Vertical Type Clips’ top retainer clip onto minimum No. 18 gage steel [0.043-inch (1.09 mm) base metal thickness] cladding support members, such as a z-girt or track, before being secured to the structure. The spacers
are fastened in conjunction with the cladding support member using No.14 self-drilling screws, which are inserted through factory provided holes in the spacers and the cladding support member and connected directly to the structural substrate wall.

3.3.3 Installation with Horizontal Type Clips: When used with Horizontal Type Clips, horizontally oriented cladding support members, minimum No. 18 gage [0.043-inch (1.09 mm) base metal thickness] steel hat channels, are attached in conjunction with the flat-topped Horizontal Type Clips that do not include the top retainer clip.

Attachment shall be by No.14 self-drilling screws, which are inserted through factory provided holes in the Spacer and the hat channel and connected directly to the structural substrate wall.

3.4 Type I, II, III, IV, and V Construction: The Cascadia Clip® Fiberglass Thermal Spacers may be used in Types I, II, III, IV, and V Construction, when installed in accordance with this report. Spacers shall be covered their full depth with noncombustible 4 pcf (64 kg/m³) density mineral wool insulation. When used on exterior walls of noncombustible materials, the spacers may be used on walls of any height. When used on exterior walls in Types I, II, III, or IV Construction with combustible cladding and noncombustible insulation, use of the spacers shall be limited to walls that are not greater than 40 feet (12 192 mm) in height above grade plane unless supported by test data complying with the acceptance criteria of NFPA 285.

3.4.1 NFPA 285 Complying Wall Assembly: The following wall assembly has been tested and complies with the acceptance criteria of NFPA 285:

- Interior finish of 5/8-inch-thick (15.9 mm) Type X gypsum board
- Steel framing of 3½-inch-deep (92.1 mm) No. 16 gage (0.054 inch) galvanized cold-formed steel
- Exterior sheathing of 5/8-inch-thick (15.9 mm) GP DensGlass exterior Type X gypsum board
- Aluminum flashing installed to close the perimeter of openings
- Air/vapor/water-resistive barrier – Henry Blueskin SA or other WRB meeting the criteria specified in Exception 2 of IBC Section 1403.5
- Cascadia Clip® Spacers
- Exterior insulation of 3½-inch-thick (88.9 mm) mineral wool
- Exterior noncombustible cladding, or Alucobond Plus FR or other ACM or MCM Exterior combustible cladding, provided a letter from the wall cladding manufacturer accepting the use of the Cascadia Clip® Fiberglass Thermal Spacers with their exterior cladding is submitted to, and the assembly is approved by, the authority having jurisdiction.

3.5 Fire-resistance Rated Wall Assemblies: The Cascadia Clip® Fiberglass Thermal Spacers may be used on the exterior side of exterior wall assemblies that have a fire-resistance rating, provided:

- The supporting substrate wall shall have the required fire-resistance rating; and
- The exterior cladding shall not detract from the fire-resistance of the substrate wall assembly; and
- Spacers shall be covered their full depth with 4 pcf (64 kg/m³) density mineral wool or other noncombustible insulation that does not contribute to the fuel loading or detract from the fire-resistance of the substrate wall assembly.

4.0 PRODUCT DESCRIPTION

The Cascadia Clip® Fiberglass Thermal Spacers are manufactured primarily from glass fiber and polyester resin. The Spacers are color coded and manufactured in depths of 2-inch, 2½-inch, 3-inch, 3½-inch, 4-inch, 5-inch, and 6-inch (50.8, 63.5, 76.2, 88.9, 102, 127, and 152 mm) and two styles: Horizontal Type Clips and Vertical Type Clips. Horizontal Type Clips have a flat outer surface for direct attachment of horizontal girts. Vertical Type Clips have a guide and retainer clip that is used to increase the ease of installation to vertical girts. Figure 1 of this report provides typical profiles.

5.0 IDENTIFICATION

Cascadia Clip® Fiberglass Thermal Spacers are color coded according to depth and identified by the Cascadia Clip® name and trademark, product name, including “Fiberglass Thermal Spacer”, and evaluation report number (ER-410). The spacer identification may also include the IAPMO Uniform Evaluation Service Mark of Conformity. Either Mark of Conformity may be used as shown below:

6.0 SUBSTANTIATING DATA

6.1 Manufacturer’s descriptive literature and installation instructions.

6.2 Reports of physical and mechanical property testing.

6.4 Report of testing for Surface Burning Characteristics in accordance with ASTM E84.

6.5 Report of testing for Determining Ignition Temperature of Plastics in accordance with ASTM D1929.

6.6 Report of Testing for Rate of Burning and Extent and Time of Burning of Plastics in accordance with ASTM D635.

6.7 Test results are from laboratories in compliance with ISO/IEC 17025.

7.0 STATEMENT OF RECOGNITION

This evaluation report describes the results of research completed by IAPMO Uniform Evaluation Service on Cascadia Clip® Fiberglass Thermal Spacers to assess their conformance to the codes shown in Section 1.0 of this report and documents the product’s certification. The products are manufactured at the location noted in Section 2.3 of this report under a quality control program with periodic inspections under the surveillance of IAPMO UES.
